

The JavaScript Core Pattern

A repeatable cross-platform application pattern - not a framework.

Wails inverted: the JavaScript SPA is the application. It owns the domain rules, state, workflows, and UI. Operating systems, devices, databases, networks, services, and native hosts are replaceable edges attached through small JavaScript interfaces.

Stable core, replaceable edge

The **core** contains the domain model, business rules, application state, use cases, workflows, and UI coordination. The **edge** contains storage, networking, location, notifications, files, background work, device APIs, and operating-system integration.

Ports and adapters

Collectively, "ports and adapters" describes the edge. Where the distinction is useful, a **port** is the stable JavaScript contract and an **adapter** is one environment-specific implementation.

Capability	Stable JavaScript contract	Replaceable implementations
Storage	get(), set()	IndexedDB, SQLite, native storage
Location	current()	Browser, Android, iOS
Notifications	send()	Web, desktop, mobile
Network	connect(), send()	HTTP, WebSocket, WebRTC, native

Dependency rule: UI -> JavaScript core -> capability contract -> platform adapter -> external system

Guardrails

- The browser build remains canonical and independently runnable.
- Business rules never move into native hosts or platform adapters.
- The core never imports a native bridge, infrastructure SDK, or platform package.
- Platform adapters are selected once during startup, not throughout the core.
- Servers may enforce shared authority without becoming the application host.

What this is not

It is not a framework lifecycle, dependency-injection container, router, state manager, base-class hierarchy, or proprietary component model. Vite+ manages the workflow; htmx and Web Components serve the UI. Extract a starter template or tiny library only after real repetition appears.

In one sentence: the JavaScript SPA is the stable application core; every operating system, device, service, and native capability is a swappable edge attached to it.
